

## Patient information

# Mesenteric Bypass Surgery

Vascular Department

**Your Consultant /Doctor has advised you to have Mesenteric bypass surgery**

### **What is mesenteric bypass surgery?**

A bypass operation places a new artery around a blocked artery to restore the circulation and relieve symptoms.

Mesenteric bypass surgery inserts a bypass graft from a major artery in the abdomen to one or more mesenteric arteries feeding the bowel and internal organs in the abdomen.

### **The mesenteric arteries are:**

- 1) The coeliac artery supplying the liver, spleen, stomach and pancreas.
- 2) The superior mesenteric artery supplying most of the small bowel and some of the colon.
- 3) The inferior mesenteric artery supplying the colon and rectum.

One or two of these may undergo a bypass procedure. In some cases an ileostomy or colostomy (bowel opening into a bag) is needed – usually as a temporary measure.

The operation is a major undertaking similar to open aortic aneurysm surgery.

The bypass grafts are usually manufactured from an artificial material called Dacron or sometimes a piece of your own vein is used.

### **What are the benefits of mesenteric bypass surgery?**

If the main arteries to the bowel and abdominal organs become blocked by atheroma (hardening of the arteries) or thrombosis (blood clot) the blood supply to the bowel and organs may be severely affected. This is called mesenteric ischaemia.

The initial symptoms may be of pain on eating, weight loss and bowel disturbance.

If the ischaemia (lack of blood) is severe the pain may become more persistent and severe leading to peritonitis, bowel perforation and eventual death.

Other symptoms of mesenteric ischaemia include diarrhoea with blood, sometimes vomiting and nausea. Angiography with a CT scan is used to identify the problem.

The aim of the operation is to restore the blood supply to the bowel and prevent the risk of gangrene to the bowel.

### **What are the risks?**

Common risks (greater than 1 in 10) include bruising and possible bleeding from the wound.

Occasional risks (between 1 in 10 and 1 in 100) include embolism (moving debris or blood clot) from a mesenteric artery into the bowel or thrombosis of the bypass graft leading to further lack of blood supply to the bowel. Additional surgery may be needed.

As with any operation, you may develop a chest infection. This is more likely if you smoke. It may need treatment with antibiotics and physiotherapy.

Occasionally, a collection of blood forms around the wound. This is called a haematoma. If this is small it may disperse by itself, but larger haematomas will need to be evacuated in a second operation. There may be more serious internal bleeding from the bypass graft itself requiring further surgery.

Collections of lymph may also occur around the arteries and the bypass graft. These may need to be drained with a needle and may persist in some patients.

Infection of the wound is a small risk (1 in 100) – infection of the bypass graft is less common than this but is a serious complication.

The abdominal wall can become weak at the site of the incision and form a hernia early on or after a period of several years.

A heart attack or disturbance of heart rhythm may also occur in 1 in 100 patients. This may lead to medical treatment especially if the heart is weakened (heart failure).

Disturbance of bowel habit may be caused by the procedure or by painkiller medications.

Some patients develop abdominal adhesions inside the abdomen that can lead to obstruction (blockage) of the small intestine.

Swelling of a leg may occur with the possibility of deep vein thrombosis or pulmonary embolism.

Internal bleeding from damage to an internal artery is possible – this may require further open surgery.

Paraplegia (spinal paralysis) is another rare complication of any abdominal aortic surgery.

Risks of stroke, transient ischaemic attack (stroke symptoms lasting less than 24 hours) and kidney failure requiring dialysis are small risks but may be fatal.

The immediate fatal risk of open abdominal aortic surgery is 5 in 100.

### **Are there any alternatives available?**

The main alternative to open bypass surgery is balloon angioplasty or stenting of the mesenteric arteries. This is a radiological keyhole procedure and has fewer risks and complications than open surgery. Unfortunately not every case is suitable for this easier procedure.

### **What happens if I decide not to have treatment?**

If you have symptoms of pain and discomfort on eating or any bowel symptom this will persist and the risk of bowel perforation and bowel gangrene (death of the bowel) will not be affected.

### **What sort of anaesthetic will be given to me?**

You will be given a general anaesthetic. General anaesthesia is drug-induced unconsciousness: it is always provided by an anaesthetist, who is a doctor with specialist training.

Unfortunately, general anaesthesia can cause side effects and complications. Side effects are common, but are usually short-lived: they include nausea, confusion and pain.

Complications are very rare, but can cause lasting injury: they include awareness, paralysis and death.

There is a risk of damage to teeth, particularly caps or crowns and veneers. Your anaesthetist will take every care, but occasionally damage can occur.

The risks of anaesthesia and surgery are lower for those who are undergoing minor surgery, and who are young, fit, active and well.

For more information, please ask for a copy of the leaflet “**You and Your Anaesthetic**” (PIF 344).

You will be given an opportunity to discuss anaesthetic options and risks with your anaesthetist before your surgery.

**If you are worried about any of these risks, please speak to your Consultant or a member of their team.**

### **Getting ready for your operation**

- You will usually be seen in the pre-operative clinic before you are admitted to hospital. Here you will have blood tests, and sometimes a heart trace or a chest X-ray. You will be assessed to see if you are fit for the anaesthetic.
- The staff will ask routine questions about your health, the medicine you take at the moment and any allergies you may have.

- You will be given instructions on eating and drinking before your operation.
- You will be able to discuss the operation with a doctor. You will be asked to sign a consent form to say that you understand the procedure, and what the operation involves.
- If you smoke, you should stop completely. The risks of stroke are greatly increased in smokers and there are additional risks of heart attack and lung disease with surgery. Advice and help is available via your physician, family doctor (GP) and through NHS 111t.

### **The day of your operation**

- You will come into hospital on the day of your operation. Please make sure you contact the ward before you leave home to check bed availability.
- Please leave all cash and valuables at home. If you need to bring valuables into hospital, these can be sent to General Office for safekeeping. General Office is open between 8.30 and 4.30 Monday to Friday.
- Therefore, if you are discharged outside these times we will not be able to return your property until General Office is open. The Trust does not accept responsibility for items not handed in for safekeeping.
- Please bring any medication you take into hospital with you.
- Please bring in toiletries, nightwear and towels.
- You will be asked to remove jewellery - plain band rings can be worn but they will be taped.
- Please leave body piercings at home. False nails and nail polish will also need to be removed if worn.
- If you are on regular medication, you will be told to take this if necessary.
- You will be asked to put on a gown and disposable underwear.
- A bracelet with your personal details will be attached to your wrist.
- You may be prescribed some medication to take before your operation by the anaesthetist. A member of the nursing staff will give this to you.
- A nurse and porters will take you to the operating theatre.
- Your dentures, glasses or hearing aid can stay with you on your journey to the operating theatre.
- When you arrive in the theatre area, the ward nurse will leave you, and you will be asked to put on a disposable hat.

- You will then be taken to the anaesthetic room and a member of theatre staff will check your details with you.

### **What should I expect after my operation?**

- After your operation you will be kept in the theatre recovery room before being transferred to the ITU or HDU (critical care unit), enhanced recovery unit or the vascular ward.
- A nurse will check your pulse, blood pressure, breathing rate and urine output regularly. We will also carefully monitor your wound for any bleeding or swelling.
- The colour, temperature and pulses in the limbs will be checked regularly after the operation.
- **It is important that if you feel any pain you must tell the nursing staff, who can give you painkillers to help.**
- The nursing staff will also advise you when you can start taking sips of water. Anaesthetics can make some people sick. If you feel sick we advise you not to drink until this feeling has passed. The nursing staff may offer you an injection to help this sick feeling go away.
- After a few days, you will be allowed to sit out, drink and eat. Return to mobility can take a few more days.

### **Going Home**

You will normally be allowed home after five to ten days depending on the extent of the operation. This may be longer if you have had surgery to remove areas of gangrene.

### **Discharge Information**

#### **Pain relief and medication**

The nursing staff will advise you about painkillers before you leave the hospital. Please tell the nurses what painkilling tablets you have at home.

#### **Your wound**

The surgeon usually uses a dissolvable suture in which case you may not require the District Nurse. Staple clips (if used) are usually removed on the eighth day.

#### **Getting back to normal**

You will probably feel tired for several weeks after the operation. Build up your activity level slowly and ensure you get enough rest. You should avoid strenuous activity for about six weeks.

You will be safe to drive when you can do an emergency stop and drive without discomfort. This will normally be at about two to four weeks but if in doubt, check with your doctor. Avoid long distances and motorway driving at first.

### **Returning to work**

Depending on your job, you will be able to resume in one to three months. If in doubt, please ask your doctor. Avoid any heavy exercise or lifting for six weeks.

### **Further Appointments**

You will have a follow up appointment in outpatients about six weeks after the operation.

### **Feedback**

Your feedback is important to us and helps us influence care in the future.

Following your discharge from hospital or attendance at your outpatient appointment you will receive a text asking if you would recommend our service to others. Please take the time to text back, you will not be charged for the text and can opt out at any point. Your co-operation is greatly appreciated.

### **Further information**

### **LiVES Contact Numbers**

**During your contact with us, it is important that you are happy with your care and treatment. Please speak to a member of staff and/or the ward/department Sister/Charge Nurse if you have any questions or concerns.**
